Short Communication

Carbon dioxide is 70 times less than artificial evaporation - evaporation of water that has not fulfilled its natural functions. It turns out that for every 70 tons of unnatural evaporation of water, there is 1 ton of carbon dioxide.

Every action in nature is connected with others, is the effect of one and the cause of the other. So in the hydrological cycle - the water cycle. Waters that have been raining for millions of years, in each cycle, moving through the soil, dissolve minerals and organic matter and create a specific solution - a building material, convey it to plants and animals. The construction of cells and bodies is completed by the ejection, exhalation, transpiration of what was water. Water molecules in waste have completely different qualities. This is the most important link in the cycle, which involves a significant part of the water that falls on land. There is a persistent erroneous opinion that the surface of the world's oceans occupies 70% of the planet, so the ocean evaporates 70% of the water.

According to <https://geographyofrussia.com/iz-4-mlrd-let-geologicheskoy-istorii-zemli-susha-by-la-bezzhiznennoj-34-mlrd-let/>: The leaf surface of plants is huge. The area of all leaves is 3-4 times the area of the entire land, i.e., in size it is not less than the area of the World Ocean. It follows that the evaporation from the land is at least equal to that from the oceans. Therefore, evaporation from biota can be of decisive importance in local sedimentation.

The purely individual molecular structures of the biota of each locality form their own special substance in the clouds, which over millions of years has developed a special quality in a given place at a given time. It was the only raw material in the production and distribution of rainfall. The natural regime of precipitation of

certain volumes of precipitation in each zone and the frequency of precipitation have stabilized. From this came all the areas of the Earth - the tropics and deserts, forests and steppes, glaciers and lakes.

Civilization has changed the world - plowed fields, irrigated agriculture, artificial reservoirs, squares of cities and buildings, ore and waste landfills, roads. Every square meter taken from nature becomes an evaporator. Civilization builds up such areas every day. Water has been deprived of its natural mission on soil - to dissolve in itself and carry minerals and organic matter for biota. Many chemical and biochemical reactions in organisms and plants that have occurred and developed over millions of years have disappeared.

The production of all products and the need for human comfort require washing, cooling, transportation, hardening, watering, drying. All this water after use is carried back into the atmosphere in increasing volumes with increasing speeds and with a completely different quality. What is the quality of water that is enclosed in a pipe and sprayed in a fountain or transferred feces. Evaporation of water that has not fulfilled its natural functions has a different quality. A new substance appeared in the clouds - they change the process of precipitation formation. Evaporation of water that has not undergone chemical and physiological reactions in living organisms and plants can be called artificial evaporation. In nature, such vapors also exist - from stones, from the surface of water bodies, but the areas of such vapors have been stabilized from the very beginning of the development of life on Earth. New areas in the form of fields, asphalt, artificial reservoirs are accelerating.

Other clouds, derived from wasted hours and days of water on the soil, form a different substance. Other raw materials also affect the mechanism of sedimentation in a different way. The new mechanism of sedimentation has no mechanism, foundations, goals, or purposes. Precipitation began to fall in the deserts and decreased in the forests. The area is being reloaded. Numerous natural disasters are created - floods, cyclones, thunderstorms, hurricanes. Vast areas are flooded, increasing new unnatural evaporations. Weighted clouds do not reach the polar and mountain glaciers. They disappear.

The generally accepted concept of the Paris Agreement to combat CO₂ emissions is aimed at the death of our offspring and all life on the planet because it distracts the attention, means and efforts of mankind. To the significant and unaccounted for volume should be added the destruction of water molecules in the air

and passing through millions of engines, compressors, furnaces. The distorted water molecules in the exhaust gases replenish the artificial evaporation.

Thus, the misdirection of human efforts to save the climate is ruining the future of the planet. To stop climate change, it is necessary to return water to its natural purpose - to reduce artificial evaporation and return the quality, volume and speed of natural evaporation to the water cycle. This is the only way to save life on the planet.
