Introduction

A new argument for why birds migrate often Southward in V shaped patterns.

Discussion

Birds are looking for a place to live, eat, find insects and give birth to children. The Hyades Constellation with Aldebaran in it is shaped like some bird groups travel like a V. The birds might be flying like the cluster Hyades with Aldebaran at the point.

Geese, duck and other birds might be following flight plan like the Hyades. The constellation consistency sometimes points south and sometimes North.

Conclusion

We made a new discovery that birds travel and migrate in V shaped cluster to follow Hyades Constellation northward and Southward.
